Project 5- Proposal

Concept statement: My goal for this project is to create a user based experience related to generating cat photos. Where the user is given an image which they are able to create a caption or “meme statement” and when submitted the image and text are integrated to be given a final Captioned Cat Image.

This is essentially a make your own meme type of page, overall I want to be included in the created of the meme/caption rather than having a randomized caption, that is unrelated to the image, so only the image is randomized.

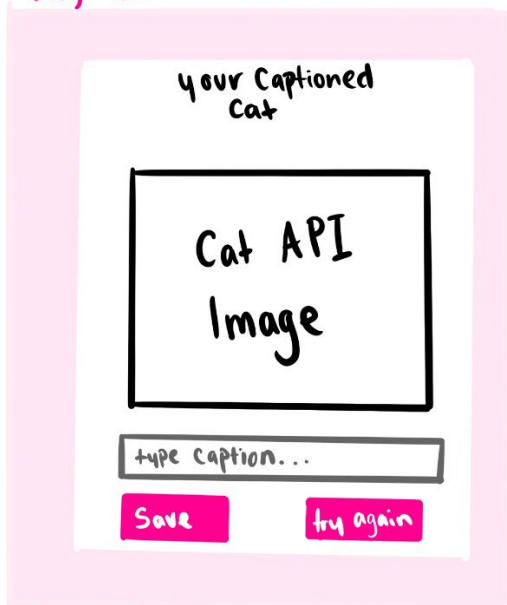

API Used: <https://api.thecatapi.com/v1/images/search?limit=1>

Design Constraints:

- (1) You must incorporate either data from JSON(online or in your codebase) or with an API
- (3) The data that the user is providing needs to correspond or communicate with the data that exists in the JSON file or API.
